BRIDGE A

Description: a bespoke design with the parapet height forming a curved feature with a high metal rail on top and lattice frame overlain on toughened glass to achieve a solid but visually open parapet.

BRIDGE B

Description: a bespoke design which uses metal “fins” of graduating height to interest to the structure. The uprights are attached to toughened glass to achieve a solid but visually open parapet.

BRIDGE C

Description: this bridge would be a modified standard bridge design which uses metal latticework of a contrasting colour to reflect the heritage of the previous footbridge, soften appearance of the solid parapet and add interest. The solid parapets over the electrified line become open at each approach.
